-1- FUNCTION: Isoform 2 lacks activity is an dominant-negative inhibitor of caspase-9.

-1- SUBUNIT: Heterodimer of a 35 kDa (P35) and a 10 kDa (P10) subunit. Caspase-9 and APAF1 bind to each other via their respective NH2-terminal CED-3 homologous domains in the presence of cytochrome Callerative PRODUCTS:

ISOLG=P55211-2; Sequence=VSP 000818;
TISSUE SPECIFICITY: Ubiquitous, with highest expression in the heart, moderate expression in liver, skeletal muscle, and pancreas. Low levels in all other tissues.
PTM: CLEAVAGES AT ASP-315 BY GRANZYME B AND AT ASP-330 BY CPP32 GENERALF THE TWO ACTIVE SUBUNITS. CASPASE-8 AND -10 CAN ALSO BE SIMILARITY: Belongs to peptidase family C14.
                                                                                                                                                           Seol D.W., Billiar T.R.; A caspase-9 variant missing the catalytic site is an endogenous inhibitor of apoptosis."; J. Biol. Chem. 274:2072-2076(1999).

I sequilated by the polygique manne tract.";
I mat. Genet. 13:442-49(1996).
I responsible for apoptoosis execution. At the onset of apoptosis it proteolytically cleaves poly(ADP-ribose) polymerase (BARP) at a 216-Asp | Gly-217 bond. Cleaves and activates sterol regulatory cleaves and activates sterol regulatory cleaves and activates sterol regulatory cleaves and activates sterol regulatory cleaves and activates sterol regulatory cleaves and activates activates activates activates capase-6, -7 and -9. Involved in the helix leucine zipper domain and the membrane attachment domain.
Cleaves and activates caspase-6, -7 and -9. Involved in the cleaves and activates caspase-6, -7 and -9. Involved in the cleaves and activates caspase-6, -7 and -9. Involved in the cleaves and activates caspase-6, -7 and -9. Involved in the subscripting proteins of a 17 kba (pl7) and a 12 kba (pl2) subunit.
Cleaves and kidney. Moderate levels in brain and skeletal muscle, and low in testis. Also found in many cell lines, highest expression in cells of the immune system.

proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a 216-Asp-|-Gly-217 bond. Cleaves and activates sterol regulatory element binding proteins (SREBPs) between the basic helix-loophelix leucine zipper domain and the membrane attachment domain. Cleaves and activates caspase-6, -7 and -9 (By similarity). Cleaves IL-1 between an Asp and an Ala, releasing the mature cytokine which is involved in a variety of inflammatory processes. SUBUNIT: Heterodimer of a 17 kDa (p17) and a 12 kDa (p12) subunit
                                                                                                                                                                                                                                                                                                                                                              TWO ACTIVE SUBUNITS. ADDITIONAL PROCESSING OF THE PROPEPTIDES IS
LIKELY DUE TO THE AUTOCATALYTIC ACTIVITY OF THE ACTIVATED
PROPEASE. ACTIVE HETEROLIMERS BETWEEN THE SMALL SUBUNIT OF
CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CPP32 ALSO OCCUR AND
                                                                                                                                                                                                                                                                                      kidney and heart. Lower expression in brain, skeletal muscle and

                                                          Cleaves and activates caspase-6, -7 and -9 (By similarity).
SUBUNIT: Heterodimer of a 17 kDa (p17) and a 12 kDa (p12) subunit (By similarity).
SUBCELJULAR LOCATION: Cytoplasmic.
TISSUE SPECIFICITY: EXPRESSED IN HEART, BRAIN, LIVER, AND MUSCLE
                                                                                                                                                                                                  PTM: CLEAVAGE BY CRANZYME B, CASPASE-6, -8 AND -10 GENERATES THE TWO ACTIVE SUBUNITS. ADDITIONAL PROCESSING OF THE PROPEPTIDES IS LIKELY DUE TO THE AUTOCATALYTIC ACTIVITY OF THE ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CEP32 ALSO OCCUR AND VICE VERSA (BY SIMILARITY).
                                                                                                                                     BUT NOT IN KIDNEY OR TESTIS.
proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a 216-ABP-|-G1Y-217 bond. Cleaves and activates sterol regularory element binding proteins (SREBPs) between the basic helix-loophelix leucine zipper domain and the membrane attachment domain.
                                                                                                                                                                      of the developing brain, but down-regulated to low levels in

Natl. Acad. Sci. U.S.A. 93:5437-5442(1996).

-!- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Cleaves and activates sterol regulatory element binding proteins (SRBBPs). Proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a 216-Asp-|-Gly-217 bond. Overexpression promotes programmed cell death (By similarity).

-!- SUBUNIT: Heterodimer of a 20 kDa (p20) and a 11 kDa (p11) subunit (By similarity).
                                                                                                                                                                                                                                                                                                     330 DAISSLPTPSDIFVSYSTFPGFVSWRDPKSGSWYVETLDDIFEQWAHSEDLQSLLLRVAN

Note-Not protectly decine;
Name-Alpha'; Synonyms-Beta;
Isoid=PSS210-3; Squence=Peta;
Isoid=PSS210-3; Squence=Peta;
Note-What we call isoform Alpha' is known in Ref.4 as Beta;
-!- TISSUE SPECIFICITY: Highly expressed in lung, skeletal muscle, liver, kidney, spleen and heart, and moderately in testis. No expression in the brain.
-!- PTM: CLEAVAGES BY GRAMYENE B OR CASPASE-10 GENERATE THE TWO ACTIVE SUBUNITS. PROPEPTIDE DOMAINS CAN ALSO BE CLEAVED EFFICIENTLY BY

Induction of apoptosis and CPP32 expression by thyroid hormone in a myoblastic cell line derived from tadpole tail.";
J. Biol. Chem. 272:5122-5127(1997).
-!- FUNCTION: Important mediator of apoptosis. At the onset of apoptosis it proteolytically cleaves poly(ADP-ribose) polymerase (PARP) at a 216-Asp-|-Gly-217 bond (By similarity).
-!- SUBUNIT: Heterodimer of a 17 kDa (p17) and a 12 kDa (p12)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Cytoplasmic (By similarity). MISCELLANEOUS: The subunits are derived from the precursor sequence by a probable autocatalytic mechanism and probably by

-!- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Cleaves poly(ADP-ribose) polymerase in vitro, as well as lamins. Overexpression promotes programmed cell death (By similarity).

-!- SUBUNIT: Heterodimer of a 18 kDa (p18) and a 11 kDa (p11) subunit (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CASPASE-8 OR -10 GENERATE THE TWO ACTIVE

DEVELOPMENTAL STAGE: Present uniformly throughout embryos of stages 4 and 10. In stage 16 embryos, the expression becomes restricted to the central nervous system, the developing gonads, and a portion of the gut. In stage 17 embryos, expression is mainly localized in cells along the midline of the central nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (AUG-2003) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution (By similarity).
Proteclytically cleaves poly(ADP-ribose) polymerase (PARP). Loss of zygotic DCP-1 function causes larval lethality and melanotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STRAIN=BERKELEY; TISSUE=Embryo; STRAIN=BERKELEY; TISSUE=Embryo; Stapleton M., Brokstein P., Hong L., Agbayani A., Carlson J.W., Chawpe M., Chavez C., Dorsett V., Dresnek D., Farfan D., Frise E., George R.A., Gonzalez M., Guarin H., Kronmiller B., Li P.W., Liao G., Miranda A., Mungall C.J., Nunco J., Pacleb J.M., Paragas V., Park S., Patel S., Phouanenavong S., Wan K.H., Yu C., Lewis S.E., Rubin G.M.,

-!- FUNCTION: Involved in the activation cascade of caspases responsible for apoptosis execution. Cleaves poly(ADP-ribose) polymerase in vitro, as well as lamins. Overexpression promotes programmed cell death.

-!- SUBUNIT: Heterodimer of a 18 kDa (p18) and a 11 kDa (p11) subunit.
                                                                                                                                                                                                                                                                                                                                           Isold=P55212-2; Sequence=VSP_000805;

WPI; 1998-001790/01. N-PSDB; AAV09401 DNA encoding interleukin-1 beta converting enzyme apoptosis protease-6 useful to develop products to treat, e.g. viral infection, tumour, Alzheimer's disease, inflammation, osteoporosis and AIDS.

Claim 4; Fig 1; 44pp; English.

This is a human interleukin-1 beta converting enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 polypeptide and agonists to the Colypeptide can be used to induce apoptosis, e.g. as an antiviral or antitumnour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICE LAP-6 polypeptide can be used to treat, Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic

The present sequence is an alternative version of human Caspase-9 also known as interleukin-1 converting enzyme (ICE) LAP6 and Mch6. Caspases care a family of cysteine proteases, that participate in the intitation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding to sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site into associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion polypeptide is used to identify a mutent cell line deficient in an enzyme of interest and is also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by overexpression of a polypeptide (e.g. Cathepsin B or urokinase, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy. Note: This sequence SEQ.ID.NO.18 is stated as being the same as that shown in page 105-107 (See AABOGEO) in the specification. However these sequences differ at

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of apoptosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 N-terminal linker sequence, a first portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 that specifically binds at least a portion of an IAP and lacks cysteine protease activity, and at least a portion of caspase-3, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP or an IAP Bir3 domain) or at least a portion of a mutated procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9 enzymatic activity, a nucleic acid molecule comprising a cype caspase-9 enzymatic activity, a nucleic acid molecule comprising a polynucleotide sequence that encodes the caspase-9 Niceminal linker), an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expression vector comprising any of the nucleic acids, a host cell containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to an epitope located on the N-terminus of a caspase-9-pl2, inducing apoptosis in a cell or stanulating apoptosis in a neoplastic or tumour cell, identifying an inhibitor or enhancer of caspase-mediated apoptosis,

        producing a compound for inhibiting or enhancing apoptosis in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or enhancing polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence represents the full length caspase-9 protein.
                                                                                                                                                                                                                                                                                                                                                                                 180
